

Test task

Create a website, in Symfony, that helps interaction with Redmine.

Features

1. Show a list of projects
2. Show a list of issues per project
3. Track time per project, or per issue. This should happen within Redmine.
4. Comment on projects. This should happen within the Symfony site. It should not post these comments back to Redmine, rather have a database that stores and shows them.

Pointers

1. There should be a simple, in memory, list of users. All users can see all projects and do anything.
2. You should use the Redmine JSON API.
3. You should use any PHP libraries that you feel help with this project.
4. Your Symfony project should follow all the normal best practices. It should be ready for production.
5. You have access to a Test project on Redmine. You can create some issues here to test against.
6. You can see a couple of other projects to show the data from.

Redmine Access

- url: <https://redmine.ekreative.com>
- username: test
- password: 9uu82T487m6V41G
- api key: 2fda745bb4cdd835fdf41ec1fab82a13ddc1a54c
